# XR Plug-in Management Issue

☐
Edit → Project Settings → XR Plug-in Management
Install XR Plug-in Management (if asked)
Enable:
✔️ ARCore (Android)
✔️ ARKit (iOS if needed)
cant see this

If you can't see **"XR Plug-in Management"**, it usually means the package is **not installed yet** (so it won't appear in Project Settings).

Follow these exact steps:

---

## ✅ Step 1 — Install XR Plug-in Management

1. Open Unity
2. Go to:

**Window → Package Manager**

3. In Package Manager:

- Change dropdown (top left) from **"In Project" → "Unity Registry"**

4. Search:

**XR Plug-in Management**

5. Click it → press **Install**

---

## ✅ Step 2 — Now check Project Settings

After installation:

1. Go to:

**Edit → Project Settings**

2. Now you will see:

👉 **XR Plug-in Management** (it will appear only after install)

---

## ✅ Step 3 — Enable AR support

Inside XR Plug-in Management:

### For Android:

- Click **Android tab**
- Tick ✔️ **ARCore**

### For iOS:

- Click **iOS tab**
- Tick ✔️ **ARKit**

---

## ⚠️ If "ARCore" still doesn't appear

Then install this too:

### In Package Manager:

Search and install:

- **AR Foundation**
- **ARCore XR Plugin**

---

## 💡 Common reason you're stuck

Most likely:
👉 You haven't installed **XR Plug-in Management package yet**, so the settings menu is hidden.

---

If you want, tell me:

- Unity version (you said 6.3 LTS)
- Android or VR headset target

I'll give you exact working AR/VR setup steps for your project (no missing menus).

there is no such option to tick under arkit

That usually happens because **ARKit/ARCore plugins are not installed yet OR you're in the wrong settings tab**. Unity only shows those checkboxes after the correct packages are installed.

Let's fix it cleanly.

---

# ✅ Step-by-step fix (do this exactly)

## 1. Install required packages

Go to:

**Window** → **Package Manager**

Then install these **one by one** from *Unity Registry*:

- ✔️ **XR Plug-in Management**
- ✔️ **AR Foundation**
- ✔️ **ARCore XR Plugin** (for Android testing)
- ✔️ **ARKit XR Plugin** (only if using Mac + iOS build)

👉 Important:
If you don't install **AR Foundation**, AR options often won't appear correctly.

---

## 2. Open correct settings

Go to:

**Edit** → **Project Settings** → **XR Plug-in Management**

Now check:

- Left side tabs:
  - Android
  - iOS
  - Standalone

---

## 3. What you SHOULD see

After installation:

### Android tab:

✔️ ARCore checkbox appears

### iOS tab:

✔️ ARKit checkbox appears (ONLY if plugin is installed + you are on Mac)

---

## ⚠️ Why you are not seeing ARKit option

Most likely one of these:

### ❌ 1. ARKit plugin not installed

→ Fix: install **ARKit XR Plugin**

### ❌ 2. You are on Windows PC

→ ARKit will NOT appear fully usable (Apple-only requirement)

### ❌ 3. Wrong platform selected

→ You must click **iOS tab inside XR Plug-in Management**

---

## 💡 Important reality check

Since you are on a normal PC (Windows):

👉 You should focus on:
✔️ ARCore (Android AR)

ARKit is only useful if:

- You use Mac + Xcode + iPhone

---

## 🚀 If ARCore still doesn't show

Tell me:

- Unity version (you said 6.3 LTS)
- Package Manager screenshot OR what you installed

I'll guide you step-by-step until AR works in your scene (camera + tracking + object placement).

- [ ] Add Image:
Click + Add Image
Select your marker image (printed image)
Set:
Name: CarMarker
Physical size: e.g. 0.2 meters

> 👉 This image is what AR will detect
>
> which image to use here i dont have any

You can use **any clear 2D image** as a marker, but some images work much better than others for image tracking.

## Use a good marker image

Choose something with:

✅ lots of details
✅ sharp edges
✅ high contrast
✅ unique pattern
✅ not repetitive

Examples:

- a movie poster
- book cover
- logo with details
- anime character art
- printed postcard
- a custom design with shapes/text

Avoid:
❌ plain white paper
❌ simple circle/square logos
❌ repeated patterns
❌ blurry images

---

## Easiest option (recommended)

I can generate a proper AR marker image for you that works well in Unity image tracking.

It can be:

- geometric pattern
- logo-style marker
- colorful detailed card

Print it or show it on another screen, and Unity can detect it.

If you want that, I can create one now.

☐
🚗 STEP 8 — Import 3D Car Model

You need a model:

Import .fbx or .obj car model
OR
Download from Unity Asset Store

Drag it into:

Assets folder
what to do here

At this step, Unity needs **a 3D object** to show when your marker is detected. It does **not have to be a car**—car is just an example.

You have 3 options:

## Option 1 (Easiest) — Use Unity built-in object ✅

Skip downloading anything.

In Hierarchy:

**Right click** → **3D Object** → **Cube**
(or Sphere / Capsule)

Then:

- Rename it → `CarModel`
- Scale it smaller:
  - X = 0.1
  - Y = 0.1
  - Z = 0.1

Use this as your AR object.

When marker is detected → cube appears.

This is easiest for testing.

---

## Option 2 — Download free car model

Go to Unity Asset Store

Search:

**free car 3d**

Examples:

- Low Poly Car
- Cartoon Car
- Vehicle Pack

Import package into project.

Then drag model into scene.

---

## Option 3 — Download .fbx / .obj model

From:

- Sketchfab
- CGTrader
- TurboSquid

Download:

`.fbx` or `.obj`

Then:

Drag file into **Assets** folder in Unity.

Unity imports automatically.

Then drag model into scene.

---

## My recommendation

For now use:

**3D Object → Cube**

First make AR work.
Later replace cube with car model.

That saves a lot of time debugging AR.

how to use sketch fab

Here's how to use Sketchfab to get a 3D model into Unity.

## 1) Open Sketchfab

Go to:

Sketchfab

In search, type:

**car free download**

(or any model: robot, animal, chair, etc.)

---

## 2) Filter downloadable models

On results page:

Turn on:

✅ **Downloadable**

This shows only models you can download.

---

## 3) Pick a model

Choose a simple model (low-poly is easier for Unity).

Open it.

Check:

- preview rotates properly
- looks complete
- not too heavy (small file size preferred)

---

## 4) Download

Click:

**Download 3D Model**

Choose:

✅ **FBX** (best for Unity)
or
✅ **OBJ**

Download ZIP file.

---

## 5) Extract ZIP

On your PC:

Right click ZIP → **Extract All**

You may get:

- `.fbx` / `.obj`
- textures (`.png`, `.jpg`)
- material files (`.mtl`)

---

## 6) Import into Unity

Open your Unity project.

In **Project / Assets**:

Drag extracted folder into **Assets**

OR

Right click Assets → **Show in Explorer** → paste folder there.

Unity imports automatically.

---

## 7) Put model in scene

Drag imported model from Assets → Hierarchy / Scene.

Adjust:

- Position = (0,0,0)
- Scale = smaller if huge
- Rotation = adjust if upside down

---

## 8) Use in AR

Make the model a child of your tracked image object / marker anchor.

When camera detects marker → model appears.

---

### Tip

Search:

**low poly car downloadable**

Those usually import cleanly into Unity.

Make it prefab:
Drag into Assets → create prefab

A **Prefab** in Unity is a reusable object template.
For your AR project, making the 3D model a prefab lets Unity spawn it whenever the marker is detected.

Here's how:

# Method 1 — Drag from Hierarchy (easy)

Suppose your imported car is in **Hierarchy**:

```
CarModel
```

Do this:

1. In **Project window**, create folder:
    - Right click → **Create** → **Folder**
    - Name it:

```
Prefabs
```

2. In **Hierarchy**, click your car model.
3. Drag it into **Assets / Prefabs** folder.

Unity creates:

```
CarModel.prefab
```

Done ✅

Now it's a prefab.

---

# How to know it worked

Prefab icon becomes **blue** (usually blue cube icon).

That means it's saved as reusable object.

---

# Method 2 — Drag from Assets

If model is already in Assets:

Drag model → Prefabs folder → Unity makes prefab.

---

# Why prefab is needed for AR

Later in **XR Reference Image Library / Tracked Image Manager**, Unity will instantiate this prefab when marker is detected.

Marker found → prefab appears.

---

Example:

Marker = printed image
Prefab = 3D car

Scan marker → car shows up 🚗

---

After creating prefab, next step is usually:

**Attach prefab to AR Tracked Image prefab / script**

Tell me what screen/menu you're on, and I'll guide the next click.

where is player setting

In Unity, **Player Settings** is inside Project Settings.

Path:

**Edit** → **Project Settings** → **Player**

## Step-by-step

1. Open Unity
2. Top menu → **Edit**
3. Click **Project Settings...**
4. In left panel, scroll down
5. Click **Player**

You'll see settings like:

- Company Name
- Product Name
- Resolution
- Other Settings
- Active Input Handling

---

## If you're looking for Input System setting

Go to:

**Edit** → **Project Settings** → **Player** → **Other Settings**

Scroll until you find:

**Active Input Handling**

Choose:

- **Input System Package (New)** ✅
  or
- **Both** ✅ (safe option)

Then Unity may ask to restart → click **Restart**.

---

If you tell me **what setting you need inside Player Settings**, I can point to the exact option.

build complete with a result of fail

"**Build completed with a result of Fail**" in Unity can happen for many reasons. The important part is the **actual error message in Console**, not that summary line.

Please do this:

1. Open **Console** in Unity
   **Window** → **General** → **Console**
2. Look for the **red error** entries.
3. Copy the **first red error message** here (or paste a screenshot text).

That first error usually tells exactly what failed (examples: Android SDK missing, Gradle error, script compile error, duplicate class, package issue).

## Quick checks while you look:

- **File** → **Build Settings** → **Android** → is Android selected?

- Did you install **Android Build Support** (SDK + NDK + OpenJDK) in Unity Hub ?
- Are there any **red script errors** in Console?

Paste the first red error, and we can pinpoint it quickly.

That screenshot only shows the **summary**, not the actual cause.

What we need is the **2 error messages** below it.

Do this in Unity:

1. Open **Console**
   - **Window** → **General** → **Console**
2. Click the **red error icon** (it should show **2**)
3. Expand the first error
4. Copy/paste the text here **OR** send a screenshot that includes the error list/details (not just the blue "Build failed" bar)

Example of what we need:

```
Gradle build failed...
Android SDK not found...
CS0246 script class not found...
Package dependency error...
```

That line will tell exactly what's wrong. Right now, "Build completed with a result of Fail" is just Unity saying **something failed**, but not **what** failed.

Found it — the error is:

> **ARCore Required apps using Vulkan require a minimum SDK version of Android API Level 29. Currently set to AndroidApiLevel25**

Meaning:

Your project is set to **Android API 25**, but **ARCore needs at least API 29**.

Fix:

## Step 1 — Open Player Settings

In Unity:

**Edit** → **Project Settings** → **Player**

---

## Step 2 — Expand “Other Settings”

Scroll down → open:

**Other Settings**

---

## Step 3 — Change Minimum API Level

Find:

**Minimum API Level**

Currently:
`Android 7.1 (API 25)`

Change it to:

✅ **Android 10.0 (API 29)**
(or higher like API 30 / 31 / 33)

---

## Step 4 — Change Target API Level

Find:

**Target API Level**

Set:

✅ **Automatic (highest installed)**

OR choose latest installed API.

---

## Step 5 — Build again

Go:

**File** → **Build Settings** → **Build**

Should work.

## If API 29 option is missing

Then Android SDK platform isn't installed.

Install via Unity Hub :

- Android SDK Platform 29+
- Android Build Support
- OpenJDK
- NDK

---

This is a settings issue, not a code issue. Once API level is updated, ARCore build should proceed.
